### CONTENTS

#### UNIT 1 DEFINING HEALTH

1.1 Introduction  
1.2 Objectives  
1.3 Different Approaches to Health  
1.3.1 Health as a Human Right Issue  
1.3.2 Feminist view of Health  
1.3.3 Social Understandings of Health  
1.3.4 The Biomedical Approach  
1.3.5 Current Approach to Gender and Health  
1.4 Health and Development  
1.5 Determinants of Health  
1.5.1 Social determinant of Health  
1.5.2 Physical determinants of Health  
1.6 Women- Specific Health Issues (Diseases)  
1.7 Women Health Movement (WHM)  
1.8 Exercise  

#### UNIT 2: CONDITIONS OF WOMEN' HEALTH

2.1 Introduction  
2.2 Objectives  
2.3 Physical and Social Issues faced by Girl Child  
2.3.1 Nutrition Status of Girl Child  
2.3.2 Son Preference  
2.4 Adolescence  
2.4.1 Factors that affect Health of Adolescents  
2.4.2 Adolescence Issues  
2.4.3 Adolescent Needs (recognition, information and counselling services)

#### UNIT 3 WOMEN AND MENTAL / PSYCHOLOGICAL HEALTH

3.1 Introduction  
3.2 Objectives  
3.3 Women and Mental health
3.4 Feminist view of Mental Health

3.5 Mental Health Care Provisions for Women

3.6 Women and Drugs

3.6.1 Why Women Abuse Substances

3.7 Exercise

UNIT 4 WOMEN AND REPRODUCTIVE HEALTH

4.1 Introduction

4.2 Objectives

4.3 What is Reproductive Health?

4.4 Reproductive Health and Feminism

4.4 Reproductive Rights

4.6 Safe Motherhood

4.7 Family Planning

4.7.1 Family Planning and Feminism

4.7.2 Family Planning and Islam

4.7.3 Male as Partners in Family Planning

4.8 Biases in Health Care System

4.9 STDs Infections and HIV/AIDS

4.10 Exercise

UNIT 5 AGING AND WOMEN’S HEALTH

5.1 Introduction

5.2 Objectives

5.3 Ageing and Feminism

5.4 Physical and Mental Issues of Aging Women

5.5 Ageing Women and Health Care System

5.6 Exercise

UNIT 6 VIOLENCE AND WOMEN’S HEALTH

6.1 Introduction
6.2 Objectives

6.3 How Violence against Women is defined?

6.4 Types of Violence against Women

6.5 Other forms of Violence against Women

6.5.1 Domestic Violence

6.5.2 Commercial Sex Workers and their Health
6.5.3 Female Genital Mutilation (FGM)
6.5.4 Female Infanticide
6.5.5 Selected Abortion

6.6 Bibliography

6.7 Exercise

UNIT 7 HEALTH OF WOMEN WITH DISABILITY

7.1 Introduction

7.2 Objectives

7.3 Why focus on Disable Women's Health?

7.4 Definition and Models of Disability

7.4.1 Medical model

7.4.2 Social model

7.4.3 Moral Model

7.4.4 Expert/Professional model

7.4.5 Tragedy/Charity model

7.5 Feminist view of Disability

7.6 Barriers to Health of Women with Disabilities

7.6.1 Physical barriers

7.6.2 Communication barriers

7.6.3 Attitudinal barriers
7.6.4 Economic barriers 60
7.6.5 other barriers 60
7.7 Exercise 60

UNIT 8  HEALTH ISSUES OF WOMEN IN CRISIS 63
8.1 Introduction 65
8.2 Objectives 65
8.3 Health Issues of Refugee Women 65
8.4 Health Issues of Displaced Women 66
8.5 Health Issues of Women in Natural Disaster 67
8.6 Health of Women in War and Conflict 68
8.7 Health of Women in Jails & Prisons 68
8.8 Exercise 69

UNIT 9  ROLE OF NATIONAL AND INTERNATIONAL INSTITUTIONS IN WOMEN'S HEALTH 71
9.1 Introduction 73
9.2 Objectives 73
9.3 Why we need a National Women's Health Policy 73
   9.3.1 Principles underlying the Women's Health Policy 73
   9.3.2 Issues of importance in Women's Health 74
9.5 Government of Pakistan and Women's Health 74
9.6 United Nations (UN) and Women's Health 75
9.7 Non-Governmental Organizations (NGOs) and Women's Health 77
9.8 Exercise 78
DEAR STUDENT

Welcome to the half credit course Women and Health (877) comprising nine units. This Study Guide will be studied in accordance with the allied material for this course.

INTRODUCTION OF THE COURSE:

The course, Women and Health (877), is one of the half credit courses for M. Sc Women's Studies and PG Diploma program. The department also offers this course as a certificate course.

Women’s Health is an emergent issue in our society. Traditionally, health research and issues focused on men with results being generalized to women. There is a great need of recognition that women’s health has unique aspects that require distinct exploration, discussion and understanding.

The evolving women's health field has begun to be shaped by a philosophy that recognizes the impact of women's multiple roles in society on health, and focuses on women's health rather than just problems. Accordingly, this course has been prepared, keeping this philosophy in mind and following the four main perspectives:

- A holistic perspective that considers the multiple influences of biological, psychological and social factors on women’s health and that embraces a wellness approach, rather than being problem-focused. Such a perspective focuses on women's assets, stressing their resiliency and positive factors that affect their health.
- A lifespan perspective that recognizes that women have different health and psychosocial needs as they encounter transitions across their lives and that the positive and negative effects of health and health behaviors are cumulative across a woman’s life.
- A social role perspective that recognizes that women routinely perform multiple, overlapping social roles.
- A women-centered/feminist perspective that considers women’s gender-specific experiences as normative and recognizes the diversity among women in their health care needs and access to adequate health resources.

This course will introduce you to a variety of women’s health issues as well as the barriers faced by women striving to achieve a healthful lifestyle. This course is designed to support you in your personal exploration of attitudes, knowledge and values related to women’s health. In recent years, the approach to women’s health has slowly moved away from one which viewed women’s health needs and the treatment of disease as no different from that of men with the exception of reproductive issues.
Besides, this course will take a broad perspective of women's health, examining medically defined illnesses, normal biological process and social and political health issues unique to women. This course presents a feminist perspective on health recognizes the social, cultural, and political paradigm which correlates women's health status, role of international and national agencies in promoting women health care institutions as well as the influence of gender on health behavior.

OBJECTIVES OF THE COURSE
After completing this course you should be able to:

- Define health from various perspectives, which include human right, social and feminist perspectives.
- Recognize the importance of the study of gender differences in health, androcentricity, medical research bias, overgeneralization and double standards on women's health from a personal and societal perspective.
- Identify women requirements of health care as newly born, girl child, adolescence, aging women, women with disabilities and women in crisis.
- Recognize women's mental, emotional, psychological and reproductive health issues from national and international perspective with special emphasis on South Asia.
- Analyze the impact of violence against women on health with reference to development.
- Demonstrate knowledge of women's various chronic diseases from social and cultural perspective along with their treatment and prevention.
- Discuss the political and social dimension of health issues of women in crisis.
- Highlight the role and contribution of national and international agencies in the field of women's health.

HOW TO STUDY:
The study material for this course comprises a study guide and allied material. The course outline spreads over nine units / topics. For each unit selected articles related to the topics have been included in the supplementary allied material. Each unit requires one week's study. If you study one unit daily to study your course you can complete the course in eighteen weeks. In mid of the study period a workshop will also be held which is an effort to help you to prepare for examinations and meet peer group and listen to the subject experts and exchange knowledge.

Please do not confine yourself to the materials, which are being supplied by the university. To enhance knowledge at postgraduate level you are expected to extensively use library and Internet.

TUTORS GUIDANCE:
In distance learning system basically the students have to study on their own. However, if there is a viable group of 10 - 15 students the university does appoint a part time or a correspondence tutor. Part time tutors hold tutorial meetings in study centers
UNIT 1

DEFINING HEALTH
1.1 Introduction
This unit begins with the introduction of different perspectives of health focusing on social, feminist and human perspectives with substantial issues that affect women health in contemporary societies. Determinants of health and significance of health as an indicator of development has also been discussed. This unit also explores women specific health issues such as breast cancer; eating disorders, sleeping disorder and tuberculosis are argued with feminist insight. International Women Health Movement (WHM) with its critique is also part of this unit.

1.2 Objectives
After reading the unit you will be able to:
- Define health from various perspectives (human right, social and feminist)
- Identify and discuss the linkage between health and development
- Identify the different determinants (social, physical) of health
- Describe women specific health issues (diseases)
- Discuss Women Health Movement (WHM) and its critique on women health issues.

1.3 Different Approaches to Health
Women health has been discussed with reference to many perspectives. It is imperative to look into women health from different perspective for encompassing a comprehensive understanding of health paradigm. In this section we will look at health from various perspectives.

1.3.1 Health as a Human Right Issue
Health is one of the fundamental human rights and there are many important linkages between health and other human rights. Still the focus on human rights within the health context is relatively recent. The right to health is an inclusive right. It can be understood as a right to the enjoyment of a variety of facilities, goods, services and conditions necessary for the realization of the highest attainable standard of health. The enjoyment of the right to health is linked to other human rights such as the right to food and education.

Key human rights principles such as participation, accountability, transparency, non-discrimination, empowerment and local ownership related to health and affect the health policies and programmes. In many ways human rights violations affect health for example:
- Human rights violations often have serious health consequences (e.g. violence against women and children, torture, female genital mutilation);
- Health programmes can promote or violate human rights in the ways they are designed and implemented (e.g. rights to information, confidentiality, privacy, participation, equality of access and non-discrimination);
- If human rights are respected, protected and fulfilled, it can reduce people’s vulnerability to ill-health (right to food and nutrition, freedom from discrimination).
1.3.2 Feminist view of Health

The feminist view can be understood in contrast to the traditional view. The traditional view looks at the many ways in which women differ from men and concludes that these differences reflect some basic differences that far transcend reproductive capacities. The feminist perspective looks at the many similarities between sexes and concludes that women and men have equal potential for individual development. Feminists claim vision of a world where all women freely make their own decisions regarding their bodies, reproduction and sexuality and more over a world where all women can fulfill their own unique potential and live healthy whole lives.

Feminist health activism grew out of the women's liberation movement of the 1960s, which argued that ideas of female inferiority pervaded the gender-segregated health care system. In The Feminist Mystique (1963) Betty Freidan assailed physicians who proscribed addictive tranquilizers to dissatisfied suburban housewives; protesters at the 1968 Miss America pageant rejected stereotypical notions of femininity; and other radical feminists organized "speak-outs" to break society's silence about abortion and rape. During the last 50 years, feminists have insisted that the ability to make their own decisions about their own bodies is a crucial foundation for achieving true equality for women.

In the 1980s there was a growth of feminist writing on health that began to identify differences in men's and women's health experiences and access to use of care facilities and to offer theoretical explanations for these differences, covering the biological and the social, which led on to further research projects attempting to prove/disprove hypotheses. In addition, in Africa, Asia and Latin America, women began to initiate and undertake research and develop critiques of the failure of biomedicine to acknowledge and connect with indigenous notions of women’s health. They aim to support women to achieve greater autonomy over their health/bodies and their work has not only recognized women’s health issues, but a broader range of questions which directly address the links between health experience and gender roles, for example, domestic and sexual violence and occupational health issues.

For more details read the following reading:

1.3.3 Social Understandings of Health

A social perspective of health is one that concentrates on improving health and well-being of the population and talks about the factors, which influence health, and well-being.
This view also draws on key social determinants that influence broadsides of health and illness with a population.

The World Health Organization has offered a definition of health that goes beyond the biomedical model and argues that health is: *A state of complete social, psychological and physical well-being and not merely the absence of disease*. Implicit within this definition is the notion that health is not purely a physical phenomenon, but is influenced by sociocultural, economic and psychological factors.

There are a whole range of alternative understandings of health and illness that very broadly the understanding of health. Some have developed as indigenous systems over centuries e.g. acupuncture, whilst others have emerged more recently, partly in response to criticisms of the biomedical approach. One group of related analyses may be referred to as models of the *social production of health and illness*. These argue that health and illness are produced through social as much as biological processes, and are products of the way in which society is organized.

1.3.4 The Biomedical Approach

The biomedical approach distinguishes between:

- Disease: a medical conception of physical pathology, indicated by a set of signs and symptoms
- Illness: a person's experience of ill-health, indicated by a person's feeling of pain and discomfort.

The 18th and 19th century marked changes in understandings of the 'natural world', and of the relationship between the individual, the environment and disease. Research in the natural sciences was influenced by the work of scientists and engineers as they developed their understanding of mechanics, leading to the conception of the natural world in mechanistic terms. The focus was upon the individual biological body as the site of disease pathology.

For example the biomedical approach views women's problematic eating behavior and consequent weight loss/gain as the core issue, and attempts to treat the symptom by physical means such as regular weight monitoring, bed rest, tube feeding and planned eating regimes, often reinforced by behavioral reward systems. It does not necessarily seek to address underlying causes, but, arguably, does perform a vital role in keeping dangerously underweight women alive.
The biomedical manner of treating women’s eating issues can miss the point of understanding them in context, i.e. as being expressions of social as well as individual dysfunction.

1.3.5 Current Approach to Gender and Health:

Despite obvious differences between women and men—biologically, psychologically, and socially—the concept of viewing the totality of women's health as different from men's health was not fully applied practically. In the 1980s, students in most Western medical schools were taught that, except for issues related directly to reproductive anatomy and function; women were medically identical to men. According to this belief system, medical research could be carried out on men and the results could simply be applied to women. Health policy makers and practitioners in 1990s begin to recognize the importance and value of gender issues to the health field. Interpretations of gender analysis in the health fields have been varied but two main approaches have been identified

- a women’s health needs approach
- a gender equity approach (also known as a gender inequality approach)

A women’s health needs approach is concerned with the implications for women of differences in the epidemiological profile between the sexes. This approach stresses that women’s particular health needs have been neglected as a result of male-centered models of health and therefore argues for the need to address these needs in a way which views women and their lives holistically - that is, it addresses the full range of women’s health problems, rather than just their reproductive health problems, and does this throughout their life cycle.

A gender equity approach is “concerned with the role of gender relations in the production of vulnerability to ill-health or disadvantage within health care systems”. So far it has focused particularly on the access to and utilization of formal health services. Equity’ can be distinguished from ‘equality’ in that while equality carries some notion of ‘sameness’, equity carries some notion of ‘fairness’. Therefore while a focus on equality would argue that men and women should be treated exactly the same (that is, not discriminated against in the provision of health care explicitly on the basis of their sex), a focus on equity argues that men and women may have different needs and face different barriers to meeting those needs or having them met.

Additionally, different needs and barriers may not lead to equal disadvantage for both sexes. An equity approach therefore stresses that health policy must consider the different and inequitable needs of men and women in allocating resources for health promotion, prevention and care.

SAQs

1. Differentiate between equity and equality.
2. Distinguish between two current approaches of gender and health.

For more detail read the following material:

1.4 Health and Development

Role of health in development is extremely important area of study both for social and behavioral sciences as these examine the relationship between health and development. Health may be used as an indicator of development in different parts of the world. It is well said that healthy people make better nation, better worker, make stronger economies and strong economies allow people to live and make good choices.

Empirical studies show that health improvement provides a signified boost to economic growth in developing countries. This leads to the view that health like education is a fundamental component of human capital and suggests that notion of health –led-growth. Better health leads to higher income and alternatively a wealthy nation.

Health system in countries all over the world faces economic challenges to meet in growing needs of the citizens’ specially women who have specified health needs. The quality of health service delivery depends on to the availability and performance of the qualified personal, sufficient provision of medical facilities and drugs.

For more information read the following material:

1.5 Determinants of Health

Health is strongly influenced by the underlying socio-economic and physical factors, which play part as determinants of health. Owing to their importance in life they are being discussed below in detail.

1.5.1 Social determinant of Women Health

A person’s health is influenced by the condition in which he/she lives. Social and economic conditions such as poverty, gender inequality, urbanization, social security, population morbidity, unemployment, social exclusion, poor housing, health care system,
education etc strongly influence health. They contribute in inequality in health which explains why people living in poverty die sooner and get sick more often than those living in more privileged conditions. Socioeconomic factors and women's status have influences on women's health. The burden of illness rests disproportionately on the economically disadvantaged women and on those with low social status. The long-term effects of social disadvantage are apparent in the excesses of morbidity among women who are not either employed at the time of their children's birth, or are women living in poor neighborhood, and those living in households without modern amenities.

Research on the effects of socioeconomic disadvantage and women's status on women's health is important for policy makers in developing countries, where limited resources make it crucial to use existing maternal and child health care resources to the best advantage. The Indian subcontinent stands alone as an area in which women have a lower life expectancy at birth than do men. The influences can be conceptualized as endemic stress that arises from social and physical environmental determinants of deprivation, inadequate resources, limited role opportunities, and oppressive cultural forces as there is a link between these factors and women's health status.

1.5.2 Physical determinants of Health

The physical determinants of health are environment (which includes biological and chemical agents which attributes to environment) water and sanitation. Physical determinants also include, medical care, effective protection against communicable diseases, safe sexuality, good reproductive health, increased awareness of healthy life style, good eating habits, safer food and health stress coping mechanism.

SAQs

1. How would you distinguish between social and physical determinants of health?
2. Enlist the social and physical determinants of health.

1.6 Women- Specific Health Issues (Diseases)

The health issues that experience women are many and varied in their nature. They are not just about the reproduction but women's overall health that affects health through relationship, work, culture and society within which women live. In this part it is
impossible to discuss all the health issues; therefore few of them are being discussed which would provide you an insight in the most common issues women which are facing around the world. Some of them may include breast cancer, eating disorders, sleeping disorders, tubercloses, cardiovasoular diseases etc. These health issues are discussed in detail in the allied material.

For information on women health issues read the following material:

1.7 Women Health Movement (WHM)

The Women's Health Movement (WHM) emerged during the 1960s and the 1970s with the primary goal to improve health care for all women. Despite setbacks in the area of reproductive rights during the 1980s, the WHM made significant gains in women's health at policy level during the 1980s and 1990s. The WHM became a powerful political force. The achievements of the movement in improving women's health during the 20th century were numerous and significant. Women formed self-help groups, influenced social policy through advocacy, and instituted new types of health delivery for women. Ultimately, the women's health movement changed medical practice, reshaped health care institutions, influenced health care policy, and improved the social status of women internally.

The Women's Health Movement (WHM), which began in the early 1970s, has significantly influenced the lives and health care of women. A direct outgrowth of dissatisfaction with paternalistic male dominance of women's health care, the WHM hoped to regain control over their bodies and medical decision-making by educating women to become knowledgeable about their health. Periodicals, particularly newsletters, have played a significant role in the empowerment process, by drawing together networks of women with common and often disease-oriented health interests.

SAQs:

1. What was the main goal of WHM of 1960 and 1970s?
2. How WHM of 1970s affect the women health issues?

For more information read the following article:

1.8 Exercise

1. The definitions of women’s health is in the process of definitional shift. Discuss it with socio-historical context of health.
2. Describe the social context of women’s health.
3. Good health is prerequisite to human production and development process. How would you analyze this statement?
4. Define determinants of health in detail.
5. What are the main causes of morbidity and mortality in developing countries?
6. Discuss the social determinants of health in detail.
7. Discuss the most prevalent diseases in women.
8. Describe the historical dimension of women’s health movement. How it dealt with women health issues.
9. Manisha Desai in her article “Gender, health and Globalization: critical social movement perspective “argues this changing gender relation have affected the discourse of global health and has raised particular concerns of women’s health. Do you agree to her point of view?
UNIT 2

CONDITIONS OF WOMEN' HEALTH
2.1 Introduction

Every woman, man, youth and child has the human right to the highest attainable standard of physical and mental health, without discrimination of any kind. Enjoyment of the human right to health is vital to all aspects of a person’s life and well-being. Even after conception, a female fetus starts facing discrimination and becomes the victim of malnutrition if she is ever allowed to be born. The continuing trend in the sex imbalance in Child Sex Ratio (CSR) against girls remains in most parts of the world especially in South Asian countries as son preference which is described as cultural phenomenon. On arrival of adolescence, throughout her life this cycle of discrimination continues. The girl child faces physical, emotional and psychological disadvantages in every stage of life including stage of adolescent. Adolescent also comes hard on girls in terms of nutrition and emotional and psychological needs. Their needs are ignored and their choices are very limited. This unit traces the social and cultural explanations of malnutrition of girls and son preference among many countries of the world and will provide a cross-cultural comparison of this phenomenon. This unit will also discuss adolescence in detail catering its issues and services available especially for girls.

2.2 Objectives:

After studying the unit, you will be able to:
1. Discuss the physical and social issues faced by female newly born in relation to nutrition and son preference
2. Define adolescence and identify the issues (physical, social and emotional) of adolescent girls.
3. Explain the needs (information and counseling services) of adolescence.

2.3 Physical and social issues faced by Girl Child

2.3.1 Nutrition status of Girl Child

Though malnutrition affects all segments of population but children appear to be more at risk than others, also the consequences of malnutrition appear to be more serious. In addition to culturally determined social behavior places the female child at a nutritional disadvantaged. This belief has gained wide acceptance in many parts of the world. South Asia has the highest rates of child malnutrition in the world, twice as high as sub-Saharan Africa.

The one reason, according to top nutritionists, is the region’s severe subjugation of women. This subjugation gives rise to a deadly cycle of malnutrition. A girl in India and Bangladesh is born underweight and malnourished. She is nursed less and fed less nutritious food than her brother. She is often denied health care and education. She is forced to work, even as a child. Her work burden increases significantly as she gets older - even when she is pregnant. She is married and pregnant when she is young, often just a teenager. She is underweight and malnourished when she gives birth to her children, who
are born underweight and malnourished. And thus cycle continues. (http://www.thp.org/reports/annual/2004/asia.htm)

For more information read the following material:

2.3.2 Son Preference

In most developing countries parents have a preference for sons over daughters. This is known as son preference. There has been a marked gap between the number of boys and girls, men and women. This gap is the result of decisions made at the most local level and family. The birth of a son is welcomed with celebration as an asset, whereas that of a girl is seen as a liability, an impending economic drain. According to an Asian proverb, "bringing up girls is like watering the neighbor's garden".

Common wisdom is that the preference for sons is motivated by economic, religious, social and emotional desires and norms that favor males and make females less desirable: Parents expect sons—but not daughters—to provide financial and emotional care, especially in their old age; sons add to family wealth and property while daughters drain it through dowries; sons continue the family lineage while daughters are married away to another household; sons perform important religious roles; and sons defend or exercise the family's power while daughters have to be defended and protected, creating a perceived burden on the household. Son preference is a cultural phenomenon too, more marked in Asian societies and historically rooted in the patriarchal system. In certain countries in the Asian region, the phenomenon is less prevalent than in others. Son preference is stronger in countries where patriarchy and patrolling are more firmly rooted. Tribal societies, which are matrilineal societies, tended to be more gender egalitarian until the advent of settled agriculture.

The psychological effect of son preference on women and the girl child is the internalization of the low value accorded by them by the society. Scientific evidence of the deleterious effect of son preference on the health of female children is scarce, but abnormal sex ratios in infant and young child mortality rates, in nutritional status indicators and even in population figures show that discriminatory practices are widespread and have serious repercussions. Geographically, there is often a close correspondence between the areas of strong son preference and of health disadvantage for females.

Discrimination in the feeding and care of female infants and/or higher rates of morbidity and malnutrition has been reported in most of the countries where this phenomenon exists. For every growing girl who dies, there are many whose health and potential for growth and development are permanently impaired.

SAQs:
2.4 Identify the psychological effects of son preference.
2.5 Enlist the factors, which contribute to son preference.

For more detail read the following material:

2.4 Adolescence

Adolescence, the transitional stage of development between childhood and adulthood, represents the period of time during which a person experiences a variety of biological changes and encounters a number of emotional issues. The ages which are considered to be part of adolescence vary by culture, and ranges from preteens to nineteen years. According to the World Health Organization (WHO), adolescence covers the period of life between 10 and 20 years of age. Adolescence is a specifically turbulent as well as a dynamic period of any person's life. Adolescence psychology addresses the issues associated with adolescence. A number of associations of the psychologists across the world now recognize this phenomenon and requirement of a separate class of specialized psychologists to deal with the issues of the adolescence.

Adolescence is also a modern cultural and social. The time is identified with dramatic changes in the body, along with developments in a person's psychology and academic career. It is also a timely period to shape and consolidate healthy eating and lifestyle behaviours, thereby preventing or postponing the onset of nutrition-related chronic diseases in adulthood.

2.4.1 Factors that affect Health of Adolescents

The health of adolescents is affected by a complex interplay of factors between the young person and their social environment. Their health is shaped by the parents and families, peers, neighborhoods, communities, schools, community organizations, faith; health care systems, media, employers and social norms, policies and laws. These factors impact young people's sense of health and well being by affecting their withstand life stresses, their ability to transition in developmentally appropriate ways and their ability to make decision about health behaviors.

2.4.2 Adolescence Issues

These factors may include emotional and personality disorders, family pressures, a genetic or biologic susceptibility, physical or sexual abuse, and a culture in which there is an overabundance of food and an obsession with thinness. Eating disorders are generally associated with teen age girls are categorized as anorexia nervosa, bulimia nervosa, binge
eating disorders, or not otherwise specified (NOS). Anorexia nervosa is a state of starvation that is caused by severe dieting. Bulimia nervosa describes a style of binging. It usually begins in early adolescence when young women attempt restrictive diets. When these diets fail, the adolescent reacts by binge eating and vomiting or taking laxatives, diet pills, drugs to reduce fluids, and excessive exercising.

Indicators of a need for intervention include behaviors, thoughts, or feelings that limit the youth’s ability to maintain positive relationships, cope with the demands of home and school life, and continue healthy development. There is no clear dividing line between mental health, mental health problems, and serious emotional disturbances during this stage of life.

2.4.3 Adolescent Needs (recognition, information and counselling services)

It has increasingly been recognized that adolescents form a specific group in society and have their own specific needs. Exploration and experimentation is the hallmark of this adolescent behaviour, which often propel adolescents towards risk-taking and in girls' case, to expose to unwanted pregnancies, STDs, substances abuse and unintended injuries. At the same time, adolescents often face constraints in seeking services including misperceptions about their own needs, fear of disclosure and service provider's negative attitudes. To overcome these constraints, there is a need to develop specifically designed services for adolescents. Adolescents friendly services should be able to attract young people meet their needs with sensitivity, and retain young clients for continuing care. Ideally, the holistic package of services must include reproductive health services, nutrition counselling, counselling to promote responsible behaviour and prevent substance abuse and services such as immunization and life skills education.

For more information read the following reading:

2.5 Exercise
1. Discuss the girlchild with reference to right to health.
2. Discuss the reasons of son preference in Asia. Why is it still persist in South Asia?
3. Define adolescents. Why one should pay attention to health of adolescents?
4. What health problems do adolescents face? What kind of adolescent services meet the need of adolescents?
5. How you would define adolescent friendly health services?
Unit 3

Women and Mental / Psychological Health
3.1 Introduction

Women are integral to all aspects of the society. However, the multiple roles that they fulfill in society render them at greater risk of experiencing mental problems than others in the community. Women bear the burden of responsibility associated being wives, mothers and careers of others. Increasingly women become as essential part of the labor force and in one-quarter to one third of households they are the prime sources of income (WHO, 1995). In addition to the many pressures placed on women, they must contend with significant gender discrimination and associated factors of poverty, hunger, malnutrition and overwork. An extreme but common expression of gender inequality is sexual and domestic violence perpetrated against women. These forms of socio-cultural violence contribute to the high prevalence of mental problems by women. (WHO, 1995).

Mental illnesses affect women and men differently — some disorders are more common in women, and some express themselves with different symptoms. Scientists are beginning to tease apart the contributions of various biological and psychosocial factors to mental health and mental illness in both women and men. In addition, researchers are currently studying the special problems of treatment for serious mental illness during pregnancy and the postpartum period. This unit explores various perspectives related to mental and psychological health of women along with main issues related to it. Mental issues involving drug abuse is also part of this unit and discusses this issue in women’s health context.

3.2 Objectives:

After reading the unit, you will be able to:

1. Explain the debates regarding mental health of the women from conventional and feminist perspective;
2. Identify the factors, issues that affect women’s mental health.
3. Discuss mental and emotional health care provision available for women.
4. Describe the affects of drugs on women’s physical and mental health.

3.3 Women and Mental Health

Women’s mental health cannot be understood in isolation from the social conditions of our lives. These conditions are characterized by social inequities (e.g., sexism, racism, ageism, and heterosexism) which influence the type of mental health problems women develop and impact on how those problems are understood and treated by health professionals and by the society. Women’s experiences of mental health concerns link to social conditions and women’s mental health. The definition of mental health used in the 1981 WHO report on the social dimensions of mental health, states that:

*Mental health is the capacity of the individual, the group and the environment to interact with one another in ways that promote subjective well-being, the optimal development and use of mental abilities (cognitive, affective and relational), the achievement of individual and collective goals consistent with justice and the attainment and preservation of conditions of fundamental equality.*
Entrenched gender based inequality represents one form of attack on women’s right to achieve good mental health, gender based violence is another. Both contribute to a tragic waste of human potential and illustrate the contention of the 1998 World Health Report’s (WHO, 1998) that: Women’s health is inextricably linked to their status in society. It benefits from equality, and suffers from discrimination.

For more detail read the following material:

3.4 Feminist view of Mental Health

Looking at mental health through a gender lens reveals that both physiological and social differences between women and men have an impact on mental health. Research on the connections between mental health status, biology and women’s life cycle changes (e.g. menarche and menopause) and on clinical differences between women and men are providing important contributions to the understanding of gender and mental health.

Feminist scholarship on mental health has followed two lines of inquiry. The first, a social causation approach, examines the features of women’s lives that enhance or undermine well-being. The social constructionist perspective involves critical analyses of methodology and conceptions of mental health and illness. This body of literature suggests that the findings of gender differences in mental health focus on the sexism of psychiatry. Although these bodies of work have remained largely distinct and have been criticized as contradictory, both are important ingredients of a general feminist perspective on mental health. Feminist therapy is used as a model for a synthesis of approaches.

Feminists say that psychological research data is often generalized from study samples that are too small to be statistically significant. Conclusions based on research conducted on males (such as in the area of personality or moral development) often aren’t true of women, that the observed phenomenology of mental illnesses in men have been used to develop diagnostic criteria and treatment methods that are biased against women. Feminist arguments are that generalization from one too many (and vice versa) and from men to women (and vice versa) should be avoided.
For more detail read the following reading:

3.5 Mental Health Care Provisions for Women

Even more than other areas of health and medicine, the mental health field are plagued by disparities in the availability of and access to its services. These disparities are viewed readily through the lenses of racial, cultural diversity, age and gender. A key disparity often hinges on a person's financial status and financial barriers block off needed mental health care from too many people. Mental health services should provide a range of services to respond to individuals' diverse needs: social, therapeutic and creative activities, self-help, practical support, medication and psychological therapies. Key areas covered in this guidance are medication and psychological therapies. Women service users clearly say that they want more access to a range of 'talking therapies' and less reliance on medication.

In many under-served populations, women have considerable mental health need. In spite of women's active involvement in a woman's health care movement, the mainline health care system continues to hold tight to its andocentric focus. If women are to be subjected to a health care system that employs sexist practices, the quality of life in their later years will continue to be jeopardized. (WHO, 1993; WHO, 1995).

For more information read the following material

3.6 Women and Drugs

People take drugs for a variety of reasons. Women do use and depend on drugs. Some women use drugs as a coping strategy during particularly stressful times in their lives. There are many different kinds of drugs, with a variety of different effects. Opiates, stimulants, tranquilizers etc, can all affect in different ways. Some drugs have side effects that alter appetites or bodily functions. Many women find that using drugs such as ecstasy (MDMA) or speed (amphetamines) can result in a loss of appetite and consequently weight loss. Women are more at risk from heatstroke than men because women have different water/fat ratio in their body. Although both women and men take
drugs, because of their different chemical make-ups, the drugs they take affect each gender differently. In addition, women experience hormonal changes throughout their lives with puberty, menopause, and pregnancy. During each of these unique phases in a woman’s life, she needs different medications to meet her body’s needs.

Women under the influence of drugs at similar or lower levels of use, develop more rapidly than men. Diseases like cirrhosis and hypertension, brain damage from alcohol abuse, lung cancer and respiratory diseases like emphysema and chronic bronchitis from smoking are common to women. Women are likelier to develop depression, anxiety and eating disorders, which are closely linked to smoking and alcohol and drug abuse. Women who use sedatives, anti-anxiety drugs and hypnotics are almost twice as likely as men to become addicted to such drugs.

2.6.1 Why Women Abuse Substances

Girls and young women are likelier than boys and young men to abuse substances in order to lose weight, relieve stress or boredom, improve their mood, reduce sexual inhibitions, self-medicate depression, and increase confidence.

Women are more likely than men to say their heavy drinking followed a crisis, such as miscarriage, divorce, and unemployment. Ageing women are likelier than older men to self-medicate with alcohol and prescribed drugs in order to deal with loneliness, financial insecurity or loss of a spouse.

For more information read the following material:

| 3.4 | Substance Abuse (Chapter 13) In New Dimensions in Women’ Health by Linda Lewis Alexander, Judith Larosa, Helaine Bader and Susan Garfield, Jones and Bartlett Pub. London. 2004 |

3.7 Exercise:
1. Discuss in detail different perspective on mental health. Discuss the feminist perspective of Psychology.
2. What are the mental disorders prevalent in women? Discuss.
3. What are the coping strategies that women apply in their daily lives?
4. How would you define eating disorders? Discuss them with reference to women
5. What are the factors affecting mental health of women. Discuss in detail with examples.
6. What is drug abuse and substance abuse?
7. What are the different dimensions of substance abuse among women?
8. Discuss the use of alcohol and issues related to alcoholism among women.
9. Define depressant, antidepressant, and anxiety drugs. What are their effects on women's lives?
10. Discuss in detail the gender biases in mental health area.
11. What are the traditional approaches to therapies and racial and cultural issues attached to it?
12. What is depression? Discuss its prevalence among women.
13. Discuss the contribution of feminist research in the medical science.
UNIT 4

WOMEN AND REPRODUCTIVE HEALTH
4.1 Introduction

Major themes of feminism are women right to her own body, access to reproductive justice and reproductive health. It is desirable for women to make decisions about their own health and well-being. Access to information is integral to a woman’s ability to make important decisions regarding her health. Many women face risks associated with pregnancy and childbirth, unintended pregnancy, sexually transmitted infections, and HIV/AIDS and FMG. Women’s reproductive health covers diseases and conditions that affect the female reproductive system which includes symptoms, diagnosis, treatment, and prevention of women's reproductive health issues. This unit while keeping feminist perspective deals and debates to those issues which covers the socio cultural and economic perspectives of women’s reproductive health.

Many married women in the developing world face an unmet need for contraception. Family planning programs exit in almost every part of the world but their existence face couple of controversies in term of social, cultural and religious grounds. This unit discusses those controversies and also looks at the family planning from Islamic perspective.

In today's world we often see the uneven distribution of healthcare that leaves many impoverished communities underserved. Economic, political and social factors all contribute to women’s access to healthcare, both internationally and at home. This unit discusses all of those issues within feminist domain providing you an insight of the diverse themes.

4.2 Objectives

After reading the unit you will be able to

- Define reproductive health and reproductive rights
- Highlight the issues and debates about reproductive health in feminism.
- Describe concerns related to concept of family planning with special reference to Islamic perspective of family planning.
- Identify and describe sexually transmitted diseases (STDs) and their effects on women’ health.

4.3 What is Reproductive Health?

Reproductive health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity, in all matters relating to the reproductive system and to its functions and processes. Reproductive health therefore implies that people are able to have a satisfying and safe sex life and that they have the capability to reproduce and the freedom to decide if, when and how often to do.

For more detail read the following material:

27
4.4. Reproductive Health and Feminism

Being a woman has implications for health. Health needs of women can be broadly classified under four categories.

1. Women have specific health needs related to the sexual and reproductive function.
2. Women have an elaborate reproductive system that is vulnerable to dysfunction or disease, even before it is put to function or after it has been put out of function.
3. Women are subject to the same diseases of other body systems that can affect men. The disease patterns often differ from those of men because of genetic constitution, hormonal environment or gender-evolved lifestyle behavior. Diseases of other body systems or their treatments may interact with conditions of the reproductive system or function.
4. Because women are women, they are subject to social diseases which impact on their physical, mental or social health. Examples include female genital mutilation, sexual abuse and domestic violence.

Implicit in this last condition are the right of men and women to be informed and to have access to safe, effective, affordable and acceptable methods of family planning of their choice, as well as other methods of their choice for regulation of fertility which are not against the law / religion and the right of access to appropriate health-care services that will enable women to go safely through pregnancy and childbirth and provide couples with the best chance of having a healthy infant.

For more detail read the following materials:

| 4.2 |

4.5 Reproductive Rights

Reproductive rights embrace certain human rights that are already recognized in national laws, international human rights documents and other consensus documents. These rights rest on the recognition of the basic right of all couples and individuals to decide freely and responsibly the number, spacing and timing of their children and to have the information and means to do and the right to attain the highest standard of sexual and reproductive health. Women's reproductive health and rights should not be adversely affected by their income level or geographical location, social policies or laws.

Reproductive rights advocates demand a comprehensive movement that addresses women's reproductive health and choices. Reproductive health is a human right for all people throughout their life cycle. Reproductive health and rights are important ends in
themselves, and women’s reproductive health is inextricably linked to their reproductive rights. Women's reproductive capacity plays an important role in shaping their lives and health experiences. This integrated approach is about a woman's total reproductive health and its relationship to her living conditions and her daily experiences at work, school, home, and on the street. The goal is not to single out parts of a woman's body, but instead see women’s lives and experiences as a whole.

Reproductive justice is a framework, which discusses how women’s health, access to medical care and economic justice, which are political issues, may be connected in the minds of our elected leaders and reflected by their actions. Reproductive health is directly tied to the economic conditions in a woman’s community, including environmental factors and experiences of women of color vis-à-vis race, class, and gender. For example, people who live where there is no market and limited access to fresh food suffer the health consequences.

The term “reproductive justice” emerged from the experiences of women of color. In the 1990s, the need for a more comprehensive reproductive choice was emphasized through reproductive health movement. This movement points out the need for measures that embraces and empowers all women, but with the understanding that there is a link between the economic means of women of color, where they live; go to school and worship and their sexual health and human rights. Organizations and activists addressing women’s reproductive rights and health, including Asian Communities for Reproductive Justice have set out to define and advance three main frameworks for addressing reproductive justice. Their analysis emphasizes the relationship of reproductive rights to human rights and economic justice.

The three frameworks are:

Reproductive Rights, which encompasses legal protections for women, such as the right to a legal abortion and the right to contraception and family.

Reproductive Health, which emphasizes necessary reproductive services such as access to pap smears and pre-natal care.

Reproductive Justice, which recognizes that reproductive oppression is a result of the intersection of multiple oppressions and is inherently connected to the struggle for social justice and human rights. Women of low economic mean suffer consequences from the lack of access to complete health care (for example, the high rate of cervical cancers among women of color/ minority). Reproductive justice integrates reproductive rights which work with economic and social justice to provide activists and supporters a framework to connect different women issues and strengthen fight to end discrimination and advocate for justice for all women. Legal rights are just one part of a much larger picture. The women’s rights movement embraces the model that fights for reproductive freedom as a human rights struggle and one that includes all matters of equality and social justice. The right to have or not to have children and the right to live in conditions
that enable each woman to make optimal choices for her own life is a key to bring about true reproductive justice for all women.

SAQs:

1. Differentiate between reproductive rights and reproductive justice.
2. What reproductive rights mean?
3. How reproductive right and reproductive justice is interrelated to each other?

4.6 Safe Motherhood

This is a term that covers a broad range of direct and indirect efforts to reduce deaths and disabilities resulting from pregnancy and childbirth. Direct efforts include those to ensure that every woman has access to a full range of high-quality, affordable sexual and reproductive health services, especially maternal care and treatment of obstetric emergencies to reduce deaths and disability. (www.whiteribbonalliance-india.org/definitions.htm).

Once considered by feminists as a second-best option, motherhood is gradually gaining favor. In the 1960s and '70s women were urged to cast off the shackles of a homebound drudgery and to seek fulfillment in the workplace. But as increasing numbers of career-minded women delayed or forwent having children, many found that success in the workplace provided only short-term satisfaction.

Reproductive health included issues such as family planning, safe motherhood, contraceptives, and the ability to control the spacing and timing of offspring. In simple words, reproductive health may be described as the comprehensive package that concerns the biological, physiological and emotional health needs for women, given the social expectations of society. The totality of safe motherhood being a biological issue and the social expectations that women find themselves in which include their as a result of motherhood, the emotional pressures to conform to sexual relationships that they have little or no control over, the continuous state of their mental health, the desire for women to have full control of their sexuality when to have children, spacing between them are the issues related to motherhood.

More than 150 million women become pregnant in developing countries each year, and an estimated 650 000 of them die of pregnancy-related causes. This death rate is roughly equivalent to 4 jumbo jets each carrying 450 passengers crashing every day! This shows the horrible situation of mother mortality.

Conventional maternal and child health programs have focused primarily on infants and children, not their mothers, and the problems of pregnancy-related death and illness among women in developing countries have been neglected by the medical, obstetric and public health communities, by international agencies and in particular by the governments of developing countries.

For more detail read the following.
4.7 Family Planning

In recent decades, there have been tremendous advances in the development of safer and more effective contraceptives, and in the provision of affordable and accessible family planning services. Yet, still millions of individuals and couples around the world are unable to plan their families as they wish. It is estimated that over 120 million couples do not use contraceptives, despite wanting to space or limit their childbearing. In addition, many women who use contraceptives nevertheless become pregnant. Other couples who want to have children are unable to conceive. (WHO, 1995) Family planning programs occupy an unusual place in the public policy arena. They exist in virtually every nation in the world, yet they continue to spark controversy in some quarters. Definitions of Family planning on the Web:

A health service that helps couples decide whether to have children, and if so, when and how many.

A system of limiting family size and the frequency of childbearing by the appropriate use of contraceptive techniques.

The availability of family planning does more than enable women and men to limit family size. It safeguards individual health and rights, preserves resources, and improves the quality of life for individual women, their partners, and their children. Let’s discuss family planning program in three main headings.

4.7.1 Family planning and Feminism

Feminism has keenly uncovered the sexual inequality of the fertility process. Sexuality of the fertility process is never a mere natural process. It is always a natural-social process. Under the system of patriarchy, female sexuality and reproduction is dominated by two kinds of power: family (which represents the interest of male householder) and the state. State through its population policy sometimes encouraging a limit, the state controls the fertility of the family according to the status of its resources at different times. These controls are upon the female. The benefits and cost of male and female in the process of fertility are imbalanced. Thus, feminists point out that it is inadequate to say simply that a decrease of reproduction rate is beneficial to females. The costs and burdens on particular groups must be considered as standards when evaluating a policy. That is, when
regulation of fertility is evaluated, a women's voice must be heard. Feminists believe that regulation of fertility is not an isolated, neutral and technical process. It is operated in a specific cultural and social environment, affected by certain values; it thus reflects a certain order of interest of the two sexes. If the cultural environment of male-centralism that sees the female as mere tool of sexuality and reproduction of the male is not fundamentally changed, the stronger the state controls fertility, the greater the weakest group suffers.

Feminism is not only criticism; it is also constructionism. It is not merely a theory, but a movement whose premises that women have equal rights with men - including in the field of sexuality and reproduction. Reviewing fertility regulation in terms of feminists has recommended many points which effects on policy making, promoting changes in the regulation of fertility. In one sentence, feminism takes a unique role in pushing forward changes of values, goals, and the transformation of the control model of governmental fertility regulation.

http://www.rand.org/pubs/research_briefs/RB5063/index1.html
(retrieved on 17.03.07)

4.7.2 Family Planning and Islam

One frequently cited barrier to more widespread adoption of family planning in Moslem countries is religious opposition. Religions vary widely in their views of the ethics of birth control. In Christianity, the Roman Catholic Church accepts only Natural Family Planning, while Protestants maintain a wide range of views from allowing none to very lenient. Views in Judaism range from the stricter Orthodox sect to the more relaxed Reformed sect. Hindus may use both natural and artificial contraceptives. In Islam, contraceptives are allowed if they do not threaten health or lead to sterility, although their use is sometimes discouraged.

For more detail read the following material:

4.7.3 Male as Partners in Family Planning

While past efforts to promote family planning and reproductive health have been largely directed at women, today there is growing recognition that men need to be more involved in these efforts. Men play a key role in preventing unintended pregnancy and the transmission of sexually transmitted infections (STIs), including HIV, and often do not get the reproductive health information or services they need. It is increasingly recognized that male involvement is critical for improving reproductive health outcomes for men and women alike.

There are some important points, which make men’s partnership important in family planning, which may include the followings:

1. Men have their own sexual and reproductive health concerns and needs, which are not always met. The focus on male involvement only as a means to improve women’s reproductive health may cause an oversight of men’s own reproductive health needs. Due to their ascribed gender roles, men tend to have little knowledge about their own physiology and health including sexual and reproductive health.

2. Men’s health status and behavior affect women’s health and reproductive health. Involving them increases their awareness, acceptance and support to their partners’ needs, choices and rights. It is important for men that they should “accept the major responsibility for the prevention of sexually transmitted diseases”.

3. Talking of female alone or male alone is not an adequate approach to reproductive health issues. Many of the decisions regarding reproductive health and family planning are made within a set of gender relations that affect them or their implementation. In addition, all methods of family planning and most methods of STDs and HIV prevention are traditionally labeled either as male-only or female-only methods. More attention should be paid in identifying to what extent each one of the methods require cooperation and support of both sexes and its implications on the health and sexual relationship of both partners.

4. Involving men gives the opportunity for increasing and communication on the issue of equality between men and women. The process of empowering men, regarding RH issues, will help them to be more sensitive to women’s needs and therefore more supportive of participating in efforts of enhancing women’s status.

For more detail read the following materials:

4.8 Biases in Health Care System

Gender inequalities in health are a consequence of the basic inequality between men and women in many societies. Despite the importance of socio-economic factors, women's health is also greatly affected by the extent and quality of health services available to them. Both non-governmental women's organizations and feminist health researchers
have in recent years identified major gender inequalities in access to services and in the way men and women are treated by the health care system. Firstly, although women are major health care users as well as providers, they are under-represented in decision-making in health care. Secondly, no justice is done in general to existing differences in position and needs of women and men in defining quality of health care, i.e. gender aspects.

Among women's organizations, there is general agreement that "gender sensitive health care should be available, accessible, affordable, appropriate and acceptable". In addition, health care for women should be adequate and not depart from a male model of health and illness. There is a need to pay attention to inappropriate health care for women on the one hand, as illustrated by the increasing medicalization of women's reproductive life menstruation, menopause, pregnancy and childbirth and (in) fertility. On the other hand, gender bias in the management of serious, life-threatening diseases such as cardiovascular disease, lung cancer, and kidney failure, as a form of inadequate care must be considered seriously threat to women's health.

Until recently, medical research has largely ignored many health issues important to women, and women have long been under-represented in medical research. In the past, research on women’s health focused on diseases that affect fertility and reproduction, while many studies on other diseases focused on men. At present, most women receive diagnoses and treatment based on what has worked for men. However, the efforts of women’s health advocates and the unveiling of inequities in medical research have led to a broadened research agenda including many of the above mentioned concerns.

### 4.9 STDs Infections and HIV/AIDS

"STD" is a term applied to more than two dozen diseases that are transmitted primarily through anal, oral, or vaginal sex. Sexually transmitted diseases (STDs) are a health problem which affects women in specific ways due to their biological characteristics. Women are biologically more vulnerable to HIV infection. Some STDs may be asymptomatic in women so that they are unaware that they are infected. Untreated STDs increase the risk of infertility and of contracting HIV. STDs are clearly a "women's health" issue. Women’s experience of STDs is also affected by number of factors such as gender roles, resources and perceptions and lack information about STDs etc

For more detail read the following material:

4.10 Exercise

Q.1 How would you define reproductive rights. Discuss the linkage between reproductive rights and reproductive justice.

Q.2 What are the main criticisms on family planning program. Discuss in detail.

Q.3 After reading article Fertility Control by Christine Lee, compare the situation of developed and under developed countries in detail.

Q.4 Describe the factors which control fertility among women in the world.

Q.5 After reading article “Reproduction” discuss competing perspectives on reproduction as a women right to choose.

Q.6 Discuss abortion within feminist debates.

Q.7 Women who are childless or decide not to have children, what kind of social process they face. Discuss within feminist perspective.

Q.8 Discuss the impact of infertility on women and men.

Q.9 Describe the reproduction technologies which are being used today. Analyze them through feminist lens.

Q.10 Discuss in detail family planning in Islam.

Q.11 Discuss the role of male in family planning. What are the benefits of male participation in family planning process?

Q.12 What are STDs. Describe the different perspectives on STDs in detail.

Q.13 Describe diverse perspectives on AIDS. What are the social concerns attached to it.

Q.14 What are the immediate and proximate causes of maternal mortality?

Q.15 Discuss the socioeconomic, cultural and political factors which affect pregnancy.
UNIT 5

AGING AND WOMEN'S HEALTH
5.1 Introduction

The problems related to ageing are to some extent socially constructed. The aging of the population in every region of world has a special impact on women, who live longer than men, suffer the double burden of gender and age discrimination and carry reproductive health problems with them into old age. Attention must be given to the social, political and economic context of health in which policies are developed and implemented. These contexts include dramatic demographic changes, reduced public resources, privatization and growing racial, class and gender inequities across the life span. This unit discusses the unique health needs of women as they grow older and move through menopause. This unit also explores the existing health care practices which limit the health care opportunities and choices of ageing women. It also outlines the challenges facing health care systems in developing countries, which have largely focused on women’s childbearing years and examines potential interventions and services.

5.2 Objectives

After reading the unit you will be able to:

1. Define ageing with reference to feminist perspective.
2. Debate the issues and concerns of ageing women.
3. Discuss the physical and mental disorders among ageing women.
4. Analyze the problems and issues related to health care system and policies regarding ageing women.

5.3 Ageing and Feminism

To be old, female and poor is a triple jeopardy (Mondonna Harrington Meyer)

Aging is a constant, predictable process that involves growth and development of living organisms. Aging can't be avoided, but how fast we age varies from one person to another. How we age depends upon our genes, environmental influences, and life style. Body changes associated with aging usually make us more vulnerable to various diseases, and to side effects and complications of medical treatment. Because the aging process slows our response time, it may take us longer to adjust to environmental changes. Aging can also be defined as a state of mind, which does not always keep pace with our chronological age. Attitude and how well we face the normal changes, challenges and opportunities of later life may best define our age.

Aging is largely culturally determined and body emphasis can obscure that fact. It is crucial to consider bodies because old women's bodies are usually invisible. From a medical standpoint, ageing women's bodies are defined by illness and ailments, by unfixable problems. From the perspective of feminist gerontology, the obstacles to better health for women are not primarily biological but cultural. There is a criticism within feminist discourse. Feminist scholars have given little attention either to ageing women or to aging. The oppression of women are discussed on the grounds of inequality and based on family, gender, race, religion, wealth, class, property and opportunities, but fail to address oppression on the basis of ageism. Feminist analysis of the absence of women
in research highlights the long-standing notion of male being normal and women as the special or different. The male medical model equates male with being human. The impact of excluding women from clinical research hurts women in two ways: 1) it reduces access to new drugs and 2) it reduces knowledge about side effects on male-tested therapies. It is known that drug metabolism; dose-response reaction and other clinical effects are different for women than men. How can testing of any drug or clinical procedure be founded if it excludes half the population? Studies show that women are at higher risk than men for medication side-effects due to the following factors: 1) smaller size; 2) higher proportion of body fat to lean tissue; 2) higher consumption of medications. The patriarchal practices of medicine perpetuate this notion, as do the vast inadequacies in traditional ethics that do not include gender as an issue to consider. Nothing highlights the gender inequalities in women's health more than aging. Research on elderly women's psychological and biological processes is not adequate. Because women live longer than men, and constitute two-thirds of those who are over 85, ageism may be only one part of the answer. Sexism may be the larger factor. It may be said that age, gender, and socioeconomic status are all factors that compound ageism.

For more detail read the following material:

| 5.1 | Ageism and Feminism: From “Et Cetera” to Centre by Toni Calasanti, Kathleen F. Slevin, and Neal King. In NWSA, Journal, Vol.: 18, No. 1 Spring, 2006. |

5.4 Physical and Mental Issues of Aging Women.

The quality of life of many older women, particularly in the South Asia, leaves much to be desired. Ageing women form a forgotten group in the health and social policies of many governments. Almost everywhere in the world, women outlive men, but their rights to inheritance and to pensions are not generally well provided for. Health care is often not geared to their needs. At the same time; older women fulfill important roles in society. They take care of younger children. Ageing women's health is affected by the social isolation that they experience, often due to the loss of a partner and health problems and disability related limitations.

Ageing women face lots of physical and mental issues which hinder their over all good health opportunities. Ageing women in developing countries endure extremes of poverty, insecurity through famine, disasters or warfare and often-minimal access to facilities. Many societies may also expect ageing women both to remain working and caring for their families while at the same time der., them a voice or social status. Some of the physical issues may include osteoporosis, menopause etc. Mental health issues of ageing
women consist of depression etc. some of these mental and physical problems are discussed in detail in allied material.

For more detail read the following materials:

5.2 Monepause and Hormone Replacement Therapy (Chapter 8) In New Dimensions in Women’ Health by Linda Lewis Alexander, Judith Larosa, Helaine Bader and Susan Garfield, Jones & Bartlett Pub. London. 2004

5.5 Ageing Women and Health Care System

Another overriding principle that will allow basic health determinants such as access to health care, food and safe water is the need to create an enabling environment in which ageing women can live. This enabling environment should be achieved by striking a balance between formal, informal and self-care. Ageing women experience more perceptual difficulties due to their longer lives. They often are required to care for a spouse. In spite of women’s active involvement in a woman’s health care movement, the mainline health care system continues to hold tight to its andocentric focus.

Ageing women experience a high burden of chronic illness, disability and this burden is highest between socioeconomic ally disadvantaged and minority women. The consequences of a mismatch between the organization, delivery, and financing of health care for ageing women and their actual needs fall disproportionately on low-income and minority women. There is cause for optimism that by improving the quality of clinical preventive services and the management of common chronic conditions and geriatric syndromes it will be possible to improve functional health outcomes, prevent or postpone disability, and extend active life expectancy for all ageing women while making progress toward eliminating health disparities among the most disadvantaged.

The dramatic growth of the older population, especially among women and populations of color, has resulted in a corresponding increase in the number and diversity of multigenerational (three to five generation) families. Given these structural inequities and the wide range of practice and organizational settings involving multigenerational families, there is a need to learn the skills, knowledge, and values to analyze critique and advocate for policies and process that will support multigenerational families. Usually, current social, health, and long-term care policies are typically designed as categorical, age-based approaches that foster competition rather than conceptualizing public policy
and responsibility across the generations. The problems related to ageing are to some extent socially constructed; therefore, attention must be given to the social, political, and economic context in which policies are developed and implemented. These contexts include dramatic demographic changes, reduced public resources, privatization and growing racial, class and gender inequities across the life span.

A feminist and multicultural approach toward policy development builds upon such interdependence and recognizes the intersections of age, race and gender across a range of substantive areas, such as health and mental health, substance abuse, interpersonal violence and child welfare. For example, the growth of kinship care, especially (great) grandparents caring for grandchildren, reflects the intersections of race, class, age, and gender on policies that impact schools, child welfare, income maintenance, and aging. There should be a life span approach toward policy development aims to prevent inequities and health disparities that increase across the life course, with ageing women of color forming the poorest and most functionally disabled group in our society.

Attaining the goal of appropriate medical care for older women requires knowledge of the changes of aging, skills in recognition and treatment of disease, and an effort to other types of treatment may also result in complications, including significant morbidity and mortality. Women generally have less access to health care than men, while in fact they need more care during their life. From early age on, women are discriminated against in food, education and vaccination programmes. Women receive most of the care during and after pregnancy. By reaching older age, women are again confronted with inappropriate quality of care.

In many developing countries, there is for example a shortage of trained health workers who are specialized in elderly care. Geriatric complaints, such as sore joints caused by overworking, bladder complaints and depression, are hardly recognized, let alone treated. Good hospital care is too expensive for many older people, and there are hardly any elderly homes. There is little access to affordable medicines. Also, people from fifty years onwards are excluded from AIDS education. As a consequence, there is still much misunderstanding in this age group concerning the disease. This is particularly distressing because AIDS has an enormous impact on the life of many elderly women; they are the ones taking care of their sick children and grandchildren.

Because elderly women often have no rights on possessions or retirement pay, they hardly have the means to provide for themselves. It used to be self-evident that their children would take care of them, but this is no longer the case. Many younger people move to the urban areas in search of a better life. The elderly stay behind alone. If women are to be subjected to a health care system that employs sexist and ageist practices, the quality of life in their later years will continue to be jeopardized.

5.6 Exercise

1. Why feminist give importance to issues of aging women. What are the factors behind this issue? Discuss in detail.
2. What are the stereotypes and myths related to menopause? Discuss.
3. Discuss the physical and mental issues of ageing women.
4. Explain with examples. What are issues of ageing women in South Asia? Describe in detail.
5. Discuss the issues related to health care system, which affects ageing women.
UNIT 6

VIOLENCE AND WOMEN’S HEALTH
6.1 Introduction

Violence against women knows no geographical boundaries, no age limit, no class distinction, no race and no cultural differences. Though differs widely in its nature, scale and impact: From bullying and harassment at work to trafficking, rape, abuse and murder of women and girls. Although specific abusive acts can occur between any two people regardless of gender, those acts do not always have the same impact or meaning. In heterosexual relationships, the male perpetrator tends to have more power and control in the relationship and is usually physically stronger. Majority of the victims are women.

Regardless of the type, violent behavior is generally learned. In some cases, violence may result from a chemical imbalance, biological disorder, or mental illness. However, in the absent of a physical cause, much of violent behavior is learned. Whilst many women display remarkable resilience, the impacts on individuals and entire families can be devastating. There are also massive social and financial costs besides worst health consequences. This unit looks at violence against women from health perspective and explores various types and forms of violence and their impact on health of women.

6.2 Objectives

After reading the unit you will be able to:

1. Define violence against women
2. Describe different types of violence and its consequences on women’s health
3. Explain various forms of violence (such as prostitution, FGM, female infanticide, selected abortion etc) and the feminist debates within these issues.

6.3 How Violence against Women is defined?

In simple words, acts that result, or are likely to result, in physical, sexual and psychological harm or suffering to a woman, including threats of such an act, coercion or arbitrary deprivation of liberty whether occurring in public or private life. The United Nations has identified gender-based violence against women as a global health and development issue, and a host of policies, public education, and action programs aimed at reducing gender-based violence have been undertaken around the world. The term "violence against women" means any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or private life.

6.4 Types of Violence Against Women

Violence against Women (VAW) is not restricted to physical abuse. It has some other types too which are briefly discussed as under.

2.4.1 Psychological and emotional abuse
Threats, insults and put-downs can be just as damaging as physical abuse because they endanger a woman's feelings of self-worth and her ability to control her own life.

2.4.2 Social abuse

This form of abuse occurs most frequently in a domestic situation where a woman is kept totally dependent on her partner and isolated from the support of others.

2.4.3 Financial abuse

A woman who is prevented from seeking employment, or who is not allowed to have a bank account or keep any of her income suffers financial abuse. Having no control of money keeps a woman totally dependent and at the whim of others, even for her basic needs.

2.4.4 Sexual abuse

Being forced to do or watch something sexual without the woman's consent, or to have pain inflicted on a woman during a sexual act can constitute sexual abuse.

2.4.5 Physical abuse

Hitting, punching, slapping, biting, kicking, bruising, breaking bones, throwing things and using weapons are obvious examples of physical abuse. The denial of human needs, such as food, water, sleep and even shelter are also forms of physical abuse.

SAQs

1. How would you define violence?
2. What is violence against women?
3. Enlist the form of violence against women

For more detail read the following material:

6.5 Other Forms of Violence against Women

Accordingly, violence against women encompasses but is not limited to the following:

(a) Physical, sexual and psychological violence occurring in the family, including battering, sexual abuse of female children in the household, dowry-related violence,
marital rape, female genital mutilation and other traditional practices harmful to women, non-spousal violence and violence related to exploitation;

(b) Physical, sexual and psychological violence occurring within the general community, including rape, sexual abuse, sexual harassment and intimidation at work, in educational institutions and elsewhere, trafficking in women and forced prostitution;

(c) Physical, sexual and psychological violence perpetrated or condoned by the State, wherever it occurs. From the final document of the Fourth United Nations World Conference on Women, 1995 describes violence against women about power and control. Some of these forms are discuss briefly as under.

6.5.1 Domestic Violence

Violence especially, domestic violence is acknowledged to be a serious social problem that affects individuals, families, communities, the workplace and the economy. Domestic violence is an abuse of power. It is when one partner usually a husband/boyfriend attempts to control and dominate the other, usually a wife/girlfriend through violence, threat of violence, or by controlling the couple's finances and social life. Domestic violence occurs when a family member, partner or ex-partner attempts to physically or psychologically dominate or harm the other.

According to WHO the Impact of violence against women affects the health status of women as: Violence against women has serious consequences for their physical and mental health. Abused women are more likely to suffer from depression, anxiety, psychosomatic symptoms, eating problems and sexual dysfunctions. Violence may affect the reproductive health of women through:

- the increase of sexual risk-taking among adolescents,
- the transmission of STDs, including HIV/AIDS,
- unplanned pregnancies,
- Various gynecological problems including chronic pelvic pain and painful intercourse.

Consequences such as HIV/AIDS or unplanned pregnancies may in themselves act as risk factors for further aggression, forming a cycle of abuse. Effects of violence may also be fatal as a result of intentional homicide, severe injury or suicide. Complications of pregnancy, including low weight gain, anemia, infections and first and second trimester bleeding are significantly higher for abused women. Poor maternal health during pregnancy and lactating periods due to domestic violence may have consequences on the health of the child. Another way to understand why domestic violence is a health issue is to look at the medical cost associated with domestic violence.

Violence against women puts undue burden on health care system as WHO describes that:
Studies from the United States, Zimbabwe and Nicaragua indicate that women who have been physically or sexually assaulted use health services more than women with no history of violence, thus increasing health care costs.

- A U.S. study indicated that rape or assault is a stronger predictor of health care use than any other variable. The medical care costs of women who were raped or assaulted were 2.5 times higher than the costs of non-victims in the year that the study was carried out.

Violence against women is a significant public health issue in countries of both the industrialized and less developed world. Violence is a major factor in women’s health and well-being. The measurable health-related costs of violence against women in Canada exceed $1.5 billion a year. These costs include short-term medical and dental treatment for injuries, long-term physical and psychological care, lost time at work and use of transition homes and crisis centers. Domestic violence also shows severe consequences on children’s health. Children who witness domestic violence are more likely to exhibit behavioral and physical health problems including depression, anxiety, and violence towards peers. Thus, domestic violence is a health care issue. It has an immense impact on the health care system. Homicide and injury, mental illness, substance abuse and repetition of violence across generations indicate the range of health problems related to domestic violence.

For more detail read the following material:

| 6.2 | Domestic Violence against Women and girls: Innocenti Digest No. 6, UNICEF, Innocenti Research Centre, Florence, Italy 2000. |

6.4.2 Commercial Sex Workers and their Health

Trafficked and prostituted women and girls have little redress against the abuse, violence, harassment and humiliation to which they are subjected. Victims of prostitution often suffer severe health consequences ranging from injuries inflicted by beatings, rapes, and unwanted sex; psychological devastation, including trauma, depression, and suicide; HIV/AIDS and other sexually transmitted diseases; and alcohol and drug abuse induced by pimps or by the women’s attempts to self-medicate. As stated by a prominent researcher,“many of the chronic symptoms of women in prostitution are similar to the long-term physical consequences of torture.” (Farley, 2004). All prostitution causes harm to women. Whether it is being sold by one’s family to a brothel, or whether it is being sexually abused in one’s family, running away from home and then being pimped by one’s boyfriend, or whether one is in college and needs to pay for next semester’s tuition and one works at a strip club behind glass where men never actually touch you – all these forms of prostitution hurt the women in it.

The commercial sex industry includes street prostitution, massage brothels, escort services, outcall services, strip clubs, phone sex, adult and child pornography, video and internet pornography and prostitution tourism.
6.4.3 Prostitution and Feminism
Since most prostitutes are women, prostitution is a significant issue in feminist thought and activism. Feminists who believe that prostitution is inherently exploitative, such as authors like Andrea Dworkin, herself an ex-prostitute, argued in the 1980s that commercial sex is a form of rape enforced by poverty (and often obvious violence by pimps). Some feminist reject the idea that prostitution can be reformed. These feminists believe that the assumptions that women exist for men’s sexual enjoyment, that all men “need” sex, or that the bodily integrity and sexual pleasure of women is irrelevant underlie the whole idea of prostitution, and make it an inherently exploitative, sexist practice. One feminist argument against Dworkin’s position is that prostitution, in so far as it joins with the perception of an inherent ‘need’ on the part of men for sexual release, is exploiting men more than it exploits women.

Sex markets have been a concern to feminists because, historically, the “skin trade” has relied predominantly on female service providers and male consumers. Feminist theorists are divided on the question of whether markets in pornographic materials and sexual services pose a threat to women in all contexts. Some feminist theorists argue that when one is paid for sex, a person contracts to give away her freedom and sexuality. Others argue that selling sex harms women only because the work carries a stigma generated from double standards of sexual morality and negative attitudes to sex, which need to be challenged. The debate over sex commerce extends to a number of social practices, including pornography, prostitution, escort services, erotic dancing and strip shows, phonesex and cybersex etc. Feminist philosophers have primarily focused on the issues of pornography and prostitution and have subsumed the other practices under one of these broad categories.

For further detail read the following material:

| 6.3 | Feminist Approaches to the Sex Industry by Barbra Sullivan, Department of Government University of Queensland. http://www.bbc.co.uk/religion/ |

6.4.4 Female Genital Mutilation (FGM)

FGM can neither be effectively understood nor addressed without consideration of a complex of inter-related gender, cultural, migration, health and human rights issues. General feminist thought sees the practice of FGM as a means to exercise social control over women in societies, which are highly patriarchal and patrilineal. There are a number of divergent feminist schools of thought that vary dramatically in their support of legislative intervention. Where the FGM-practicing community is in a minority, women
are thought to be particularly vulnerable to psychological problems, caught as they are between the social norms of their own community and those of the majority culture. FMG not only physically but also emotionally and psychologically harm women.

For detail information read the following material:

6.4 Female Genital Mutilation (FGM) by Dawn Haney
http://haneydaw.myweb.uga.edu/twwh/fgm.html (1-10)

6.4.5 Female Infanticide
Sex bias or son preference places the female child in a disadvantaged position from birth. In some communities, however, particularly in Asia, the practice of infanticide ensures that some female children have no life at all, violating the basic right to life laid down in article 6 of the Convention on the Rights of the Child. Selective abortion, foeticide and infanticide all occur because the female child is not valued by her culture, or because certain economic and legislative acts have ruled her life worthless. This is a systemic and more scientific form of violence against women.

In certain parts of India and Pakistan, women are still considered unnecessary evils. In the past, when victorious armies took their revenge on defeated communities, women were raped as part of the spoils of war. Subsequently, these communities resorted to killing their daughters at birth or when the enemy was advancing, to spare the female population and community from shame. Modern techniques such as amniocentesis and ultrasound tests have given women greater power to detect the sex of their babies in time to abort. Illegal abortion, particularly of female fetuses, either self-inflicted or performed by unskilled birth attendants, under poor sanitary conditions has led to increased maternal mortality, particularly in South and South-East Asia.

SAQs:
1. What is female infanticide?
2. Identify the few reasons of female infanticide.

For more information read the following material

2.4.6 Selected Abortion

Most abortions are caused because the pregnancy is unplanned and having a child causes a crisis for the woman. Therapeutic abortions result from a medical problem where allowing the pregnancy to continue to birth would endanger the woman’s health. Selective abortions, which are a small fraction of all abortions, occur in those cases where a particular foetus is perceived as having undesirable characteristics. Selective abortion is also done when there are too many fetuses in a pregnancy.

These include cases where:

- the unborn child is a girl, and the parents, for cultural or other reasons, want a boy
- the foetus does not suit the parents in some other way
- the foetus is defective

But this medical facility has been used against female fetus. In the last 20 years, international organizations and Asian nations have stepped up their efforts to eliminate sex-selective abortions, which have created a massive dearth of girls in many nations over the past years. One expert who spoke at the United Nations estimates that up to 200 million women and girls are missing worldwide because of sex-selective abortion and female infanticide. Feminists like to blame this rapidly-worsening situation on “patriarchy,” but that has been around for thousands of years and is less powerful today than ever before. What is new is the access to abortion in so many places. One school of thought blames feminist for this by saying that as it has long been a paramount goal of feminists: To grant the “right to control her own body” to each woman on Earth via unrestricted abortion. That, combined with falling prices for the ultrasound machines that can reveal an unborn child’s sex, has produced the disastrous situation that the Asian world is in now.

6.6 Bibliography

6.7 Exercise

1. Discuss in detail the rationales given by the abuser for violence against women (VAW)?
2. Describe the forms of “women bettering” in detail.
3. Define the different forms of violence. What are the socio-cultural, historical and economical perspectives of violence against women?
4. Describe sexual harassment as a form of social control and its effects on women in work places.
5. Discuss violence against women as a global issue. Compare the role of government and NGOs in combating violence against women (VAW).
6. Describe the major health issues of women in sex industry.
7. Discuss the feminist approaches to prostitution and how these approaches may be useful in studying prostitution.
8. Critically analyze the causes of female infanticide and selected abortion. How can female infanticide be stopped from South Asia?
9. Farhat Moazzam in her article discusses the feminist discourse on female foetus. What are the different points of view she presented in the article? Discuss.
UNIT 7

HEALTH OF WOMEN WITH DISABILITIES
7.1 Introduction

In recent years, women’s health has emerged as a prominent public health priority. Research focused on women’s health has led to valuable information about how and why certain diseases affect women disproportionately, predominantly, or differently than men. Yet despite the increased awareness of women’s health, research to date has not adequately addressed the health concerns of women with disabilities. In general terms, disability refers to “limitations in physical or mental function, caused by one or more health conditions, in carrying out socially defined tasks or roles. Disability rests on longstanding misconceptions and stereotypes about the disadvantages of impairment. Recent work from a wide variety of perspectives (e.g., feminist, liberal, and communitarian etc) suggests that there should be rethinking on the nature, concept and experience of disability with reference to women. Although there is a growing interest in women’s health, research addressing the health of women with disabilities is a new and emerging field. In this unit an effort has been made to look at the health issues of women with disabilities with feminist perspective which focus on the women centered point of view instead of traditional approach to health issues. Attention has been given to health women with disabilities with regard to health care system and biases in health care system. This unit also explores and highlights the areas which should be given immediate and special attention in health paradigm to the needs of women with disabilities.

7.2 Objectives

After reading the unit you will be able to:
1. Define disability with special reference to women.
2. Describe feminist view of disability.
3. Explain issues and barriers to healthcare with reference to women with disabilities.

7.3 Why a focus on disable Women’s Health?

Women are more frequently affected by many of the conditions that cause disability. The most common causes are associated with chronic conditions such as back disorders, arthritis, heart disease, respiratory problems, and high blood pressure. Disabilities may also result from injuries or birth defects.

There is a great need that women’s with disabilities health may be given serious consideration. Experiences of exclusion, being devalued, of assumptions about incapacity, and the need for (often unwanted) help all intersect in a particularly powerful way for women with disabilities. Women with disabilities are the poorest of the poor around the world. In every sphere of life, women with disabilities in the developing world experience a triple bind: they are discriminated against because they are women, because they are disabled and because they are from the developing world. Many women are disabled due to the practice of female circumcision in parts of Africa, Asia and the Middle East. Women are disabled with urinary and gynecological infections, fistulas that prevent walking and through trauma induced by the procedure.
In many developing countries, there are few educational opportunities for disabled girls. When there are opportunities for education, in special schools, boys usually receive them.

7.4 Definition and Models of Disability

Disability" is a broad term that encompasses a sizeable range of conditions and diseases. It refers generally to a limitation in physical or mental function caused by one or more health conditions. Disabilities are limitations in usual, daily activities due to chronic conditions and include physical and mental limitations arising from a variety of health conditions. The International Classification of Functioning, Disability and Health (ICF), produced by the World Health Organization, distinguishes between body functions (physiological or psychological, e.g. vision) and body structures (anatomical parts, e.g. the eye and related structures). Impairment in bodily structure or function is defined as involving an anomaly, defect, loss or other significant deviation from certain generally accepted population standards, which may fluctuate over time. Some of these models are as under.

7.4.1 Medical model

The medical model views disability as a problem of the person, directly caused by disease, trauma or other health condition, which requires medical care provided in the form of individual treatment by professionals. Management of the disability is aimed at cure or the individual’s adjustment and behaviour change. Medical care is viewed as the main issue, and at the political level the principal response is that of modifying or reforming health care policy.

7.4.2 The Social Model

The social model of disability, on the other hand, sees the issue mainly as a socially created problem, and basically as a matter of the full integration of individuals into society. Disability is not an attribute of an individual, but rather a complex collection of conditions, many of which are created by the social environment. Hence the management of the problem requires social action, and it is the collective responsibility of society at large to make the environmental modifications necessary for the full participation of people with disabilities in all areas of social life. The issue is therefore an attitudinal or ideological one requiring social change, which at the political level becomes a question of human rights.

7.4.3 Moral Model

Moral model refers to the attitude that people are somehow morally responsible for their disability, including at one extreme as a result of bad actions of parents if congenital or as a result of practicing witchcraft. This attitude can be seen as unjust and causes unnecessary suffering.

7.4.4 Expert/Professional model
The Expert/Professional Model has provided a traditional response to disability issues and can be seen as an offshoot of the Medical Model. Within its framework, professionals follow a process of identifying the impairment and its limitations (using the Medical Model), and taking the necessary action to improve the position of the disabled person. This has tended to produce a system in which an authoritarian, over-active service provider prescribes and acts for a passive client.

7.4.5 Tragedy/Charity model

The Tragedy/Charity Model depicts disabled people as victims of circumstance deserving of pity. This and Medical Model are probably the ones most used by non-disabled people to define and explain disability. There are some other models of disability too such as the Social Adapted model, the Economic model, and Religious model etc. http://en.wikipedia.org/wiki/Disability

7.4.6 Feminist view of Disability

Looking at disability through the lens of a feminist, and at feminism from a disability perspective enriches both feminism and disability studies with fresh insights. Women with disabilities experience a high incidence of abuse - physical, emotional and sexual. This makes disability rights as a feminist issue. It is an issue that affects many women, either personally or through friends or family.

Feminist Disability Studies begins with the assumption that disability is always inextricably linked to gender, race, sexuality, and social class. Issues explored within the formulations of the social model of disability have been subject to critical amendment by disabled women. Disabled women activists have, however, been equally critical of the failure of mainstream feminism to recognize the disability perspective.

Psychiatric disability is informed by trauma, marginalization, sexist norms, social inequalities, concepts of irrationality and normalcy, oppositional mind-body dualism, and mainstream moral values. Drawing on feminist discussion of physical disability, feminist theory of psychiatric disability not only focuses on disabled women but also on the mind and moral consciousness. Like the women's movement, the disability movement is now experiencing internal debates about issues of commonality and difference. Recent critiques of the social model of disability have advocated a move towards a so-called feminist emphasis on the individual experiences of disability and impairment.

For more detail read the following material:

7.6 Barriers to health of Women with Disabilities
Recent studies suggest that women with disabilities encounter many of the same health problems as women who are not disabled, yet they consistently report poorer health. The findings also identify disparities between women with and without disabilities on a number of leading health indicators. Barriers to health may include the following.

7.6.1 Physical barrier. Such as mammogram machines and scales that require a patient to stand, or exam tables that can’t be lowered for wheelchair transfers. Women with mobility limitations may find it painful or physically impossible to position appropriately.

7.6.2 Communication barriers For women with hearing or visual impairments, essential health information may not be available in a form they can access, including Braille, large print, audio recording or simplified language.

7.6.3 Attitudinal barriers. Disability training for providers and medical students is needed to reassess negative attitudes and faulty assumptions. Medical professionals often assume that women with significant disabilities are asexual and may fail to provide essential preventative care such as breast exams, mammograms, pap smears and screening for intimate partner violence.

7.6.4 Economic barriers that play a significant role in preventing women with disabilities from accessing health care. Additionally, medical exams and routine procedures may take significantly more time for people with disabilities, but reimbursement does not compensate for the additional time, providing a financial disincentive to health providers.

7.6.5 Other barriers, such as the need for medical research related to this population and lack of transportation or childcare, among others. Transportation can be a major barrier in making and keeping appointments. Some of them may include policy barriers; lack of information about how disability affects health; limited finances; and insufficient personal assistance.

For more detail read the following material:

7.7 Exercise

1. Define Disability and different models of Disability.
2. After reading article of Rosemarie Thomson (Feminist Disabilities Studies), discuss the feminist disabilities studies.
3. What is feminist philosophy of disability, care ethics and mental health? Discuss.
4. Discuss the obstacles faced by women with disabilities in health care services
5. What are the barriers to health care services for women with disabilities and care? Discuss.
UNIT 8

HEALTH ISSUES OF WOMEN IN CRISIS
8.1 Introduction

According to UN Report, 2000, the world’s refugee population of today is estimated at 12 to 15 million persons and the number of internally displaced persons (IDPs) at about 25 million. In the absence of many adult men, women have to shoulder extended responsibility for the elderly, the disabled and the children. During all phases of the refugee or displaced cycle or any other crises like these, women therefore represent a main resource for the survival and the wellbeing of the community. Their health and security is inherent part of whole group. Refugees or displaced women and men share the same difficulties, but women face additional which are gender specific threats and problems. This unit explores the health specific issues of women who are facing crisis situations of various types. These may include the health care concerns options and availabilities of the health care system of refugee women, displaced women, women in drought, war and in imprisonment.

8.2 Objectives

After reading the unit you will be able to:

1. Describe health issues of refugee women, displaced women, women in war, conflict and women in prison.
2. Explain the gendered nature of disaster and issues related to women in disaster.
3. Discuss the health needs and options of women living in crisis situations.

8.3 Health Issues of Refugee Women

Refugee women face problems during resettlement in host countries that are often worse than those faced by voluntary migrants. Although these problems are generally thought to be related to previous traumatic experiences, this may not always be the case; there are many refugee women who may not have personally experienced torture or trauma but who nonetheless express needs that suggest a perception of profound marginalization from the mainstream society.

There are many spheres which needs attention in order to improve the status of refugee women’s general health. Some of them may include general information, childbearing issues, health beliefs and practices, health-illness focus, stress and adaptation, etc.

Mental health problems are also present refugees, especially among women. This is due to the traumatic events experienced by refugees, and women in particular. Some women may have had pre-existing conditions which were triggered or worsened by the stress of what happened to them. Other women experience new onset conditions as a result of the stress of the homeland situation, trauma, flight, or relocation. Depression and anxiety disorders are seen very common among these women. In refugee women who have experienced physical or sexual torture, develop this disorder more. In addition to traumatic occurrences, many women develop high levels of anxiety upon being separated from their families, which increases the chances of developing Post Traumatic Stress Disorder (PTSD).
Some studies have shown that the period of the greatest psychological strain for refugee women is the first year after their arrival in any place. The role changes a refugee woman undergoes and the lack of understanding she may have of the system contribute to this. However, there is no time in a refugee's life when there is no risk of stress. Refugee women come from many different backgrounds and may find themselves in a setting completely unlike that which they are used to. Major psychosocial issues in resettlement may include housing, transportation, language, customs and protocols and use of technology etc. For more detail read the following

8.4 Health Issues of Displaced Women

The often cited statistic says that 80 per cent of displaced populations are women and children. If mass displacement occurs—whether due to conflict, famine or other causes displaced populations, including women, are usually without any health care services. Families may become separated, and women and girls may be at risk of gender-based and sexual violence from soldiers, border guards, bandits and others.

Leaving homes, property and community behind, renders women vulnerable to violence, disease and food scarcity, whether women flee willingly or unwillingly. Women are uprooted as a result of many different circumstances, including among other things, armed and other forms of conflict (international and internal) and foreign occupation; ethnic, religious, cultural and gender-based persecution; sexual violence, and economic necessity. Internally displaced women face additional dangers as they are often invisible to the international community within the borders of countries at war. Camps for refugees and the internally displaced have been criticized for not addressing women’s needs and concerns in their design and procedure. Failure to account for women’s security and health needs can make a camp dangerous and deadly, when it was intended to provide refuge.

Like refugee women, internally displaced women face the burdens of extreme poverty, changes in family and community structure and consequent family violence, and manipulation of culture. Amidst these struggles, the burdens of survival for themselves and their families also fall on women’s shoulders. Women struggling to provide for their families without protection (legal or physical) and often with little or no resources may turn to menial jobs or prostitution. As displaced person puts heavy strains on a woman’s health. When improvements are made in the general security situation of refugee life, sanitation, access to water, food and basic health facilities need to be addressed. Sexually transmitted diseases, above all AIDS, represent a major threat to women’s physical security among many refugee and displaced populations. Women are often forced to walk or to be carried to distant health posts to receive proper medical and maternal care. This
may have fatal consequences for pregnant women, especially those requiring birth attendants. Many women have aborted, miscarried or been delivered of stillborn infants. Very few receive pre- and post-natal medical services. For decades they were largely ignored and forgotten, but together they comprise probably the world’s largest group of vulnerable people. A significant number of displaced women in South Darfur, Western Sudan, suffer from depression and experience suicidal thoughts because of largely unaddressed mental-health problems.

For more detail read the following material:

8.5 Health Issues of Women in Natural Disaster
When a natural disaster occurs, everyone suffers but women suffer the most. According to the international human rights group, Global Fund for Women (GFW), during and following catastrophes such as the 2004 tsunami, women are more likely to experience rape or domestic violence but less likely to have their health needs met by relief groups and to be involved in decision making about reconstruction efforts.

More women die than men as the direct and indirect result of natural disasters, according to research presented at the Royal Geographical Society’s annual conference in London today (2006). This effect is strongest in countries with very low social and economic rights for women. In contrast, in those countries, in which women in their everyday lives have almost equal rights as men, natural disasters kill men and women about equally.

Physical differences between men and women are unlikely to explain the result, for example; women are often at an advantage in famines because they can cope better with food shortages due to their lower nutritional requirements and higher body fat. Social norms can provide some explanation. In many countries women are supposed to look after children, the elderly and their homes which hamper their own rescue efforts in a most all types of natural disasters. Yet, the most important reason why women are more vulnerable to the fatal impact of natural disasters is because of their lower social and economic status in many countries. With existing patterns of gender discrimination, boys are likely to receive preferential treatment in rescue efforts and both women and girls suffer more from the shortages of food and economic resources in the aftermath of disasters. Natural disasters are a tragedy in their own right but in countries with existing gender discrimination women are the worst hit. While most disasters cannot be prevented, policy makers, international and humanitarian organizations must develop better policies to address the special needs of women in the wake of large-scale natural disasters.

8.6 Women in War and Conflict

Neglecting reproductive health in the regions of conflict and emergencies has serious consequences, a report from the United Nations Population Fund (UNFPA) concludes. Unwanted pregnancies, preventable maternal and infant deaths, and the spread of sexually transmitted infections, including HIV/AIDS, can result in regions where populations are under stress and reproductive issues take a backseat to other problems.

Failure to provide for the reproductive needs of populations affected by crisis can also undermine an entire nation. Countless women and girls all over the world suffer the trauma of war as widows or orphans, perhaps displaced from their homes, sometimes detained. They are often separated from loved ones and become victims of violence and intimidation. For the most part they are civilians caught in the crossfire, and show astonishing resourcefulness and resilience in coping with the disintegration of their families, the loss of their home and their belongings and the destruction of their lives. International humanitarian law, which grants general protection to all war victims, regardless of gender, provides extensive specific protection for women in war. If these rules were better observed, the suffering faced by women in war would be greatly reduced.

For more detail read following material.

8.7 Health of Women in Jails & Prisons

Just because a woman has been deprived of her liberty does not mean she can be humiliated, abused or treated inhumanely. Yet around the world countless women in prisons and jails are being targeted for human rights violations because of their gender and because they are vulnerable. Many are at risk of torture, including rape, and other forms of sexual violence. Many are denied health care that they desperately need. Many are singled out for cruel punishments, discriminated against and treated as sub-human.

Since jails historically have held predominantly men, facilities and services have not been developed to meet the special needs of women in jail; women face a range of medical, psychological, educational, vocational, and social problems in jails. The impact of imprisonment on the health of women is obvious. In a prison system primarily designed for men, women's health needs are often not addressed by prison policy, programs and procedures. As such, medical issues that relate to reproductive health and to the
psychosocial issues that surround imprisonment of women are often overlooked. Many imprisoned women are survivors of physical and sexual abuse, have greater risk for having high-risk pregnancies, and for developing life-threatening illnesses such as HIV/AIDS, Hepatitis C and HPV cervical cancer. Moreover, despite being imprisoned and presumably safe from harm, in multiple prisons women are victims of sexual abuse by prison staff, at times during routine medical examinations.

In regards to mental health, imprisoned women may also have a higher prevalence of depression than imprisoned men. Other mental illnesses may include, major depression, schizophrenia, PTSD (post-traumatic stress disorder) and addiction disorders. Due in part to the high prevalence of mental health diseases in prisons and to the isolative and disempowering nature of imprisonment, death from suicide may occur in prison. The mental health of women prisoners is also affected by the hostile prison environment. This is especially expected given that many prisoners have been subjected to a lifetime of physical, mental and sexual abuse. With the continuation of abuses in prison, including physical abuse and rape, prison can begin to destroy people psychologically. Subsequent reports indicate that the problems continue, and may have worsened in many institutions. They include inadequate access to health services; failure to refer seriously ill inmates for treatment and delays in treatment or failure to deliver life-saving drugs for inmates with HIV/AIDS.

For more details, read the following material:

8.8 Exercise

1. Discuss the major health issues of refugee women in detail.
2. Explain the health problems of women who are displaced during war or famine or any other reason like this.
3. Discuss the health issues of women who face natural disaster.
4. In her article Patricia Hynes explains many factors which effect women’s health in war-torn counties. Discuss them in detail.
5. What is meant by the concept of gendered nature of natural disaster? Explain.
6. Discuss how natural disaster effect women’s health.
7. Violence against women as instrument of war. Comment
8. How war and women’s health is interrelated. Discuss
9. What kind of reforms you suggest must be kept in mind for women prisons?
10. What are the major issues of women head with them are imprisoned.
ROLE OF NATIONAL AND INTERNATIONAL INSTITUTIONS IN WOMEN'S HEALTH
9.1 Introduction

Women suffer countless disadvantages compared with men. Even after decades of progress, women make up two thirds of the world’s 880 million illiterate adults, and up to 70 percent of its poorest citizens. But health remains the cruelest of all inequities. Healthy women are the foundation of healthy families, which foster healthy prosperous societies. Experience shows that even small investments in women’s health can pay large social dividends. It is very difficult to disentangle the social web of health, violence, literacy, and fundamental rights. For the most part, it is impossible to raise health standards without addressing these issues because they are so intricately connected. A woman who is domestically oppressed does not learn to read and therefore cannot understand a product label or a prescription bottle. Reduced education, economic opportunity, control of resources, and control of the size of the family have an immediate and profound effect on the health and development, both physical and emotional, of women and their children. It is a frustratingly complicated cycle to break. Women’s health issues always get a main importance on the agenda of national, international and NGOs forum because of the above mention facts. In this unit we look at women’s health from through the work of these institutions in order to know how these institutions are dealing with women’s health in their agendas. This unit will also explore how much still need to be done in women’s health as issue of high priority.

9.2 Objectives

After reading the unit you will be able to:
1. Discuss the role and principle of health policy.
3. Describe the role of UN in women health sector.
4. Define the role of NGOs in women health areas.

9.3 Why We Need a National Women’s Health Policy

A national women’s health policy is developed in order to recognize the position of women in society and the way this affects their health status, their access to health services according to their needs. The formulation of any national women’s health policy must provide a framework and planned strategy to improve the health of women and to meet their health care needs to the years ahead.

9.3.1 Principles underlying the Women’s Health Policy

The women’s health policy is based on an understanding of health within a social context as emphasized by the World Health Organization and endorsed by the Pakistani Government. National policy ‘Health for all is a slogan which recognizes that: health is determined by a broad range of social, environmental, economic and biological factors; differences in health status and health outcomes are linked to gender, age, socioeconomic status, ethnicity, disability, location and environment; health promotion, disease prevention, equity of access to appropriate and affordable services, and strengthening the
primary health care system are necessary, along with high quality illness treatment services; and information, consultation and community development are important elements of the health process.

Women's health policy must encompass all of a woman's lifespan, and reflect women's various roles in Pakistani society, not just their reproductive role. Women's health policy must aim to promote greater participation by women in decision making about health services and health policy, as both consumers and providers. Women's health policy must recognize women's rights, as health care consumers, to be treated with dignity in an environment which provides for privacy, informed consent and confidentiality. Women's health policy must acknowledge that informed decisions about health and health care require accessible information which is appropriately targeted for different socioeconomic, educational and cultural groups. Women's health policy must be based on accurate data and research concerning women's health, women's views about health, and strategies which most effectively address women's health needs.

9.3.2 Issues of importance in Women's Health

There are many health issues which play a special role in women health in any country's policy but some of the priority health issues for women may be identified as important for serious consideration at national and international level. These are reproductive health and sexuality; the health of ageing women; women's emotional and mental health; violence against women; occupational health and safety; the health needs of carers; and the health effects of sex role stereotyping. However, women's health concerns extend beyond specific health problems to include the structures that deliver health care.

The broad structural areas of the health system in which action is required to improve women's health have therefore been identified: improvements in health services for women; the provision of health information for women; research and data collection on women's health; women's participation in decision making in health; and training of health care providers.

SAQs

- What are the main points in policy making?
- What are the broad structural areas which require improvement in women's health sector?

9.4 Government of Pakistan and Women' Health

From developmental point of view, the term 'health' has quite different connotation from the one that is commonly perceived. It is much more than just health caring system. It encompasses economic, political, environmental and social conditions. In a complex society as is ours in the present modern era, things have got more interlinked and dependent on each other, making it both conceptually and practically impossible to look at such as issue like health in isolation. A person can not be healthy if he is poor, unemployed, and illiterate, living in a politically instable system or in a society where women are not empowered. Therefore issues like poverty, unemployment, political instability, illiteracy and women incarceration are some of the issues which need to be
9.5 The United Nations (UN) and Women’s Health

Nearly seventeen years ago in Sept. 1994, the United Nations International Conference on Population and Development (ICPD) convened in Cairo, Egypt to reach consensus on a Programme of Action. Prior to ICPD, often called the Cairo Consensus or Cairo Accord, the global focus at that time was on demographic targets and quotas as the way to slow population growth and further economic development. This landmark conference was unique in that it was the first to address the following important issues all in one forum: population and sustainable development; reproductive health and family planning; gender equality and empowerment of women; health, morbidity, and mortality of women; and resource mobilization for economic development.

The Cairo accord, many countries have been able to translate the commitments they made at Cairo into successful policies and programs. So, in some parts of the world, progress has been quite visible. In Sri Lanka, absolute levels of mortality among girls are lower than in other South Asian countries; Follow-up activities to the ICPD have included the Fourth World Conference on Women in 1995, the ICPD +5 in 1999, and the Fourth World Conference on Women 5 in 2000.

Beijing, the 4th World Conference on Women went beyond the ICPD platform by identifying 12 critical areas of action specific to women, some being: women and poverty, the health of women, armed conflict and women, the economies and women, the environment, and women’s roles in decision-making, not only family decision-making but the role of women in politics. With regard to women’s health, incorporated directly into the 4th World Conference plan of action was the following language, “Good health is essential to leading a productive and fulfilling life, and the right of all women to control all aspects of their health, in particular their own fertility, is basic to their empowerment.” The Fifth Asian and Pacific Population Conference were held in Bangkok in 2002. This region unequivocally reaffirmed its commitment to ICPD and ICPD +5. This was a stunning victory for women’s health advocates in the face of formidable obstacles, notably the United States delegation under a new administration with a mandate to roll back ICPD.

The UN Population Fund organized three thematic high-level roundtables in the framework of the 10-year review. One is the Global Consultation on HIV/AIDS and Reproductive Health in the New Millennium: Getting Priorities Straight. This roundtable bring together global leaders from both the reproductive health and HIV/AIDS fields to reach consensus on a set of actions that need to be taken to ensure more effective integration and linkage between policies and programmes that address HIV/AIDS and those that address reproductive health.

The UN Population Fund organized a two-day Roundtable on Promoting Reproductive Health and Rights: Reducing Poverty, with high-level policy-makers, experts and selected social and opinion leaders. Globally, women’s health issues have attained higher international visibility and renewed political. There is no doubt that UN takes women’s
properly tackled if health system in a given society is to be stated satisfactory. A national health policy is a document which is supposed to cover all these areas. Dr. Talib Lashari (program coordinator/ advisor on National Health Policy) and says that Pakistan still lacks an unambiguous health policy.

The failure of successive national governments in Pakistan to developing any compact and comprehensive health policy, is due to various factors, which other than the fragmented urban health services and problems related to public expenditure, also include “issues related to development projects like overlapping, gaps in planning and implementation, vertical programs, dependency of provinces on federal government for funding which delays the projects, problems and imbalance in human resources; lack of regulation of private sector; problems with planning process; issue of access; and poor community involvement.

Deploring the irrationality of the decision making process regarding health policy in Pakistan, Talib says “This is due to three reasons: Health does not get priority in overall decision-making process, health expenditures hardly differ from previous budget; within the health sector, there is no proper use of minimal resources and; decision-making takes place in isolated manner without including all stakeholders i.e. legislatures and civil society etc. Lack of continuity of policies, lack of community participation, lack of government initiatives to bring the private health sector in the main stream of health care, lack of government initiatives to bring the private health sector in the main stream of health care, lack of good governance and ‘lack of necessary skills and interest on the part of some of the stakeholders which include public representative; and NGOs’, are some of the other factors which contribute negatively in that whole saga.

Dr. Talib concludes with much emphasis is laid on the decentralization of health policy process. Looking at the history of health initiatives taken by different governments in Pakistan, it is not difficult to understand that the theory of centralization of health policy has not proved successful in achieving the targets. Especially after the introduction of ‘Devolution Plan’ in 2001 in the country, it seems appropriate to decentralize the whole process and involve districts directly in the implementation of health initiatives while residing policy formulation with the federal government.

No development is possible without improving health of a nation. The development is defined as a process which is supposed to contribute in raising the life standards of people. Development further depends on economic, political and social conditions and unless these are improved, the analysis of societal health will be counted below the graph.

SAQs

- What are the main interlinked areas which effects health of a person?
- Write down some negative points which hinder practical implementation of health policies?
- How the role of civil society is important in women’s health?

For more information read the following:

| 9.1 | National Health Policy 2001-The Way Forward (Agenda for Health Sector Reform) Ministry of Health, Government of Pakistan |
health issue on its front agenda but there is still much more to do internationally by using UN forums.

SAQs
- Name the country where last international world conference on women was held in 1995?
- What are major tasks which UN perform regarding women’s health?

9.6 Non Government Organizations (NGOs) and women’s Health

Non-governmental organizations (NGOs) historically have played a significant role in the provision of health services in many countries of the world, around particularly in rural areas. In this context, NGOs are defined as private agencies, usually operating on a not-for-profit basis that are affiliated with community organizations, religious entities, or international charitable and/or aid organizations. During the past two decades of a growing burden and shrinking resource base in the public sector, the private sector, primarily NGOs, have expanded their role in service delivery too.

NGOs are increasingly visible and diverse, from small grassroots NGOs to multi-million-dollar budgets giants, such as CARE or Human Rights Watch, largely funded by governments. As these examples suggest, today’s information age has been marked by the growing role of non-governmental organizations (NGOs) on the international stage. Many NGOs claim to act as a global conscience, representing broad public interests beyond the purview of individual states. They develop new norms by directly pressing governments and businesses to change policies, and indirectly by altering public perceptions of what governments and firms should do. NGOs do not have coercive hard power, but they often enjoy considerable soft power the ability to get the outcomes they want through attraction rather than compulsion.

Adequate health care services are essential for the women’s health. To meet basic needs they must be able to respond to women as well as men in the society. Non-governmental organizations (NGOs) play a particular role in hearing health care needs, interpreting them to other players, including health care institutions, and in delivering services. A greater appreciation of NGOs’ particular current and potential roles can help to contribute to the provision of appropriate health care services to women and people who are in minorities (old persons, religious minorities, ethnic minorities etc).

SAQs
- What are NGOs?
- What is the role of NGO in any country?
- Discuss role of any NGO who is working in women’s health sector?

For more detail read the following material:

9.2 The Role of NGOs in Promoting a Gender Approach to Health Care by Marianne Haslegrave, Commonwealth Medical Association.

accessed 27th Dec. 2006
